Tensor-Optimized Hardware Accelerates **Fused Discontinuous Galerkin Simulations** Alexander Breuer, Alexander Heinecke (Intel), Yifeng Cui

Extreme-scale Discontinuous Galerkin Environment (EDGE) \star Focus: Problem settings with high geometric complexity, e.g., mountain topography Vanilla ★ Unique support for fused simulations exploiting Modeling Parameters inter-simulation parallelism Fused Simulations Floating Point **+** Rapid prototyping through support for: Line elements, quads, triangles, hexes, tets Convergence Rate \star Parallelization: Assembly kernels for AVX, AVX2, Verification Study AVX512 and AVX512_4FMA extensions, utilizing HSP1a LOH. HSP1b LOH. all x86 CPUs of the last five years optimally; HHS1 Can4 OpenMP+MPI (custom and overlapping) **World record seismic wave propagation** Illustration of EDGE's modeling and simulation performance: 10.4 DP-PFLOPS on Cori II [1] characteristics are tighly coupled, requiring a **★** Continuity: Continuous Integration (sanity) comprehensive approach. The parallelization checks), Continuous Delivery (automated (SIMD, shared memory, distributed memory) is convergence + benchmarks runs), code coverage, license checks, container bootstrap determining modeling parameters. Together License: BSD 3-Clause (software), CC0 for supporting files, e.g., user guide

Fused Simulations Exploit Inter-Simulation Parallelism

"Why is this a good idea?"

- ★ Idea: Exploit input parallelism by fusing multiple, similar simulations in a single execution of the solver
- \star EDGE supports this idea at all levels of parallelism, starting at a single vector op
- \star Fusing multiples of the vector-width (KNL, SKX, KNM): 16 simulations in single precision allow for perfect vectorization without zero ops
- \star Fusion of multiples of 64 bytes (16 simulations) leads to alignment to cache-lines without artificial zeropadding
- **★** Read-only data structures are shared among all fused simulations

"Similar simulations?"

core parallelization.

- **±** EDGE imposes restrictions on fused seismic simulations: 1) Identical mesh for all fused simulations
 - 2) Identical simulation parameters: start and end time, convergence rate, "frequency" of wave field output, "frequency" and location of seismic receivers 3) Identical material parameters (velocity model)
 - 4) "Sources" mostly arbitrary: Arbitrary initial DOFs, kinematic sources: arbitrary location and moment rates, spontaneous rupture: identical friction law, other initial parameters arbitrary

Contribution #1. Verification of	32hit Precision - Revend Arti

Science- and HPC-driven

Top: Weak and strong scaling study on Cori-II (KNL). Shown are hardware and non-zero hardware peak efficiencies of all configurations in cache and flat mode. O denotes the order and C the number of fused simulations. The weak scaling uses a moderate total of 276,480 tetrahedrons per node. The mesh of influenced by a multitude of factors. The the strong scaling contains 340,727,199 tetrahedrons, presented verification study is key in discretizing the LOH.1 benchmark (see below). [1]

with other parts of the pipeline, highlighted in Right: EDGE's homepage http://dial3343.org and software gray, the study's results drive EDGE's single- repository https://github.com/3343/edge.

General Applicability and Availability

- \star Verification efforts transfer directly to DG-FEM \star Artifact appendix of this poster contains solvers, relying on unstructured tetrahedral meshes, e.g., SeisSol or DGCrack
- **±** LIBXSMM optimizations transfer easily to community codes, using the library, e.g., CP2K, NekBox, Nek5000 or SeisSol
- ★ Parallelization through fused simulations / multiple right hand sides is a novel technique for improved efficiency. Approach is applicable to other software, facing challenging efficient SIMD utilization due to small matrix kernels, e.g., SpecFEM3D or Nek5000
- \star Commercial libraries, e.g., Intel's MKL, recently added compact-vectorized routines, running batched BLAS routines. The underlying idea is similar, but would annihilate the presented speedups due to required element matrix duplication and zero padding. Suggests adoption on the library level

- software (BSD-3) and data (CC0):
- \star Presented LOH.1 verification runs are available from http://doi.org/10.17605/ OSF.IO/H9G5N and shared with other modelers through http://sismowine.org/
- \star Additional verification settings in 2D (Garvin's problem, Gaussian Hill, Gaussian Hill-Canyon and Mount San Jacinto topography) and in 3D (HHS1, HSP1a, HSP1b, LOH.1, LOH.2, Can.4) are available from http://opt.dial3343.org
- \star All presented work on the solver EDGE is available from https://github.com/3343/ edge
- \star All presented work on the LIBXSMM library is available from https:// github.com/hfp/libxsmm
